

ABSTRACT

Luxury consumption has undergone significant transformation in recent decades as consumer motivations have shifted from purely functional needs toward emotional and symbolic benefits. Consumers increasingly perceive luxury brands as vehicles for identity expression, emotional gratification, and social recognition. In this context, understanding the emotional drivers influencing purchase intention becomes essential for both academic research and managerial practice.

The present study investigates the influence of emotional determinants on the purchase intention of luxury products. Specifically, the research examines the effect of **Emotional Response, Celebrity Influence, and Fear of Missing Out (FOMO)** on consumer purchase intention toward luxury goods.

Primary data were collected using a structured questionnaire administered to consumers familiar with luxury brands. A total of **105 valid responses** were analyzed using **SPSS statistical software**. Reliability analysis was conducted to evaluate the internal consistency of the measurement scales, followed by **multiple linear regression analysis** to examine the relationships between the emotional determinants and purchase intention.

The regression results indicate that emotional factors significantly influence luxury purchase intention. The regression model explains **64.1% of the variance in purchase intention ($R^2 = 0.641$)**. Among the predictors, **Emotional Response emerged as the strongest determinant ($\beta = 0.631$)**, followed by **Fear of Missing Out ($\beta = 0.263$)** and **Celebrity Influence ($\beta = 0.158$)**.

The findings highlight the importance of emotional engagement in luxury marketing strategies. Luxury brands should therefore focus on emotional storytelling, aspirational branding, and social influence strategies to enhance consumer purchase intention.

Chapter 1

INTRODUCTION

1.1 Conceptual Framework

The origins of luxury products can be traced back several centuries, with early documented examples such as **Château Haut-Brion in 1525** and **Hermès in 1837**, two of the earliest companies known to have maintained records of the production and sale of luxury goods. Historically, luxury products primarily functioned as symbols of wealth and social hierarchy, serving as visible indicators that distinguished affluent individuals from the broader population. Over time, however, the meaning and purpose of luxury consumption have evolved considerably.

In contemporary markets, luxury products extend beyond their traditional role as status symbols and increasingly serve as mediums through which consumers express their identity, personal values, and lifestyle preferences. Luxury consumption is therefore no longer driven solely by economic signaling but also by emotional and symbolic value. Among modern consumer segments, particularly millennials, luxury products such as watches, handbags, and designer footwear are often purchased not only for their functional utility but also for the emotional gratification they provide. Ownership of luxury products can enhance an individual's confidence, reinforce personal identity, and communicate refined taste or lifestyle preferences.

Emotional Determinants of Luxury Consumption

Emotional determinants represent the psychological motivations that influence consumers' attitudes and behaviors toward luxury products. These determinants help explain why consumers develop intentions to purchase luxury goods beyond their functional benefits.

Emotional Response refers to the affective reactions experienced by consumers when interacting with luxury brands or products. Emotional experiences such as pride, excitement, satisfaction, and prestige often enhance the perceived value of luxury products and strengthen consumers' purchase intentions. Emotions play a critical role in shaping consumer decision-making and behavioral responses toward brands (**Bagozzi, Gopinath, & Nyer, 1999**).

Celebrity Influence refers to the impact of endorsements or associations with well-known personalities on consumer perceptions of luxury brands. Celebrities often embody aspirational

lifestyles that consumers admire and wish to emulate. According to the meaning transfer theory, celebrities transfer symbolic meanings such as prestige, attractiveness, and social status to the brands they endorse, thereby enhancing brand desirability and influencing consumer purchase intentions (McCracken, 1989).

Fear of Missing Out (FOMO) represents the apprehension that others may be experiencing rewarding events or opportunities from which one is absent. This phenomenon motivates individuals to remain socially connected and participate in aspirational consumption behaviors in order to maintain social belonging and avoid feelings of exclusion. Exposure to luxury lifestyles through social media and peer comparisons can therefore increase consumers' desire to purchase luxury products (Przybylski et al., 2013).

In the context of luxury consumption, these emotional determinants collectively shape consumers' attitudes toward luxury brands and influence their intention to purchase luxury products. The theoretical foundations of luxury consumption emphasize the importance of emotional and symbolic value in shaping consumer behavior (Kapferer & Bastien, 2012; Wiedmann, Hennigs & Siebels, 2009).

Accordingly, the present study examines the influence of **Emotional Response, Celebrity Influence, and Fear of Missing Out (FOMO)** on consumer purchase intention toward luxury products.

1.2 Rationale of the Study

The global luxury industry has experienced rapid expansion in recent decades, fueled by rising disposable incomes, globalization of brands, and increasing exposure to aspirational lifestyles through digital media. Traditionally, luxury goods were associated with exclusivity and were accessible only to elite consumers. However, modern markets have witnessed the emergence of a broader group of aspirational consumers who seek luxury products as symbols of personal success, identity expression, and emotional gratification.

Younger consumers, particularly millennials and Generation Z, increasingly view luxury brands as tools for constructing and communicating their social identities. Luxury consumption allows individuals to express their personality, values, and lifestyle preferences. Rather than focusing

solely on product functionality, consumers often evaluate luxury products based on the emotional and symbolic meanings associated with them.

The rapid growth of social media platforms has further transformed the landscape of luxury consumption. Digital platforms expose consumers to aspirational lifestyles, celebrity endorsements, and influencer-driven marketing content that frequently highlights luxury products as indicators of success and prestige. This exposure can significantly influence consumer perceptions and create aspirational consumption patterns.

One important psychological phenomenon associated with social media exposure is Fear of Missing Out (FOMO). Consumers may experience anxiety when they perceive that others are enjoying desirable experiences or products that they themselves do not possess. This phenomenon can motivate individuals to purchase luxury products in order to maintain social relevance and avoid feeling excluded.

Celebrity endorsements also play an important role in shaping consumer attitudes toward luxury brands. Celebrities often serve as role models whose lifestyles consumers aspire to emulate. When luxury brands are associated with well-known personalities, they gain additional symbolic value that enhances their attractiveness among consumers.

Despite the growing importance of emotional and psychological factors in luxury consumption, many traditional marketing strategies still emphasize product attributes such as quality, durability, and craftsmanship. While these factors remain important, contemporary research suggests that emotional engagement may play a more significant role in influencing consumer purchase intentions.

Therefore, it becomes important to examine how emotional determinants influence consumer purchase behavior in the context of luxury products. Understanding these relationships can provide valuable insights for luxury marketers seeking to design effective branding and communication strategies. The present study aims to contribute to this understanding by empirically examining the influence of Emotional Response, Celebrity Influence, and Fear of Missing Out on purchase intention using multiple linear regression analysis.

1.3 Objectives of the Study

The present study aims to examine the influence of emotional determinants on the purchase intention of luxury products. The specific objectives of the study are:

- To identify the key emotional determinants influencing consumer purchase intention toward luxury products.
- To analyze the impact of emotional determinants, including Emotional Response, Celebrity Influence, and Fear of Missing Out (FOMO) on the consumers' purchase intention toward luxury products.

1.4 Literature Review

Luxury consumption has attracted considerable attention in consumer behavior research because it represents a complex interaction of economic, social, and psychological factors. Unlike ordinary consumer goods, luxury products are typically purchased not only for their functional attributes but also for the symbolic meanings and emotional experiences they provide to consumers. Scholars have consistently argued that luxury consumption is strongly associated with emotional gratification, social recognition, and identity expression.

According to **Kapferer and Bastien (2012)**, luxury brands are distinguished by their exclusivity, heritage, craftsmanship, and symbolic value. They argue that the true value of luxury brands lies in the emotional experiences and aspirational meanings associated with them rather than merely in the functional characteristics of the product. Luxury brands create a sense of prestige and exclusivity that enables consumers to express their social identity and personal aspirations.

Similarly, **Wiedmann, Hennigs, and Siebels (2009)** proposed a value-based model of luxury consumption that explains luxury purchasing behavior through four key dimensions: financial value, functional value, individual value, and social value. Among these, individual and social values are particularly relevant because they reflect the emotional and symbolic motivations underlying luxury consumption. Individual value includes emotional satisfaction and self-identity, while social value relates to prestige and status recognition.

The role of emotions in consumer decision-making has been extensively discussed in marketing literature. **Bagozzi, Gopinath, and Nyer (1999)** argue that emotions play a crucial role in shaping

consumer attitudes, preferences, and behavioral intentions. Emotional experiences influence how consumers evaluate brands and determine whether they develop positive purchase intentions. In the context of luxury products, emotional responses such as pride, excitement, and happiness significantly enhance the perceived value of the brand.

Research has also highlighted the importance of **celebrity endorsements** in influencing consumer perceptions of luxury brands. According to **McCracken (1989)**, celebrities serve as cultural icons whose symbolic meanings can be transferred to brands through endorsement relationships. When consumers admire a celebrity, they often associate the celebrity's traits and lifestyle with the endorsed brand. As a result, luxury brands that collaborate with well-known celebrities may benefit from enhanced credibility, attractiveness, and aspirational appeal.

Another important factor influencing consumer behavior in contemporary markets is **Fear of Missing Out (FOMO)**. The concept of FOMO has gained prominence in recent years due to the rapid growth of social media platforms. **Przybylski et al. (2013)** define FOMO as the apprehension that others may be having rewarding experiences from which one is absent. This psychological phenomenon often motivates individuals to participate in trends and activities in order to maintain social belonging and avoid feelings of exclusion.

In the context of luxury consumption, social media exposure frequently showcases aspirational lifestyles and luxury products. Consumers who observe others enjoying luxury experiences may feel motivated to purchase similar products in order to maintain social relevance. Studies have shown that social comparison mechanisms associated with FOMO can significantly influence purchase intentions, particularly among younger consumers who are highly active on digital platforms.

Research conducted by **Shukla (2012)** further demonstrates that emotional appeal and social value significantly influence luxury purchase intentions, particularly in emerging markets where luxury consumption is often associated with personal success and social mobility. Consumers in such markets may perceive luxury products as symbols of achievement and status.

Overall, the literature suggests that luxury consumption is strongly influenced by emotional and psychological determinants. Emotional responses, celebrity influence, and fear of missing out all contribute to shaping consumer attitudes toward luxury brands and their willingness to purchase

luxury products. These insights provide the theoretical foundation for the present study, which seeks to empirically examine the influence of these emotional determinants on luxury purchase intention using multiple linear regression analysis.

1.5 Research Hypotheses of the Study

Based on the conceptual framework and prior research on luxury consumption behavior, this study proposes that emotional determinants play a significant role in shaping consumer purchase intentions toward luxury products. Luxury consumption is often influenced by psychological motivations, symbolic meanings, and social influences rather than purely functional product attributes.

Consumer behavior research suggests that emotions experienced during interactions with luxury brands can significantly affect attitudes and behavioral intentions. Emotional responses such as excitement, pride, and satisfaction can strengthen consumers' attachment to luxury brands and increase their likelihood of purchase. Similarly, celebrity endorsements and aspirational figures may influence consumer perceptions of luxury brands by enhancing their symbolic value and desirability.

In addition, the growing influence of social media and digital platforms has intensified the psychological phenomenon known as **Fear of Missing Out (FOMO)**. Exposure to luxury lifestyles, trends, and peer consumption patterns can motivate individuals to purchase luxury products in order to maintain social belonging and avoid perceived social exclusion.

Since multiple emotional and social factors may simultaneously influence consumer purchase decisions, the present study examines the combined influence of **Emotional Response, Celebrity Influence, and Fear of Missing Out (FOMO)** on purchase intention using **multiple linear regression analysis**. Regression models allow researchers to evaluate how several independent variables jointly affect a single dependent variable while controlling for the influence of other predictors in the model.

Accordingly, the following hypothesis is proposed:

H1: Emotional determinants, including Emotional Response, Celebrity Influence, and Fear of Missing Out (FOMO)—have a statistically significant influence on consumers' purchase intention toward luxury products.

H0: Emotional determinants, including Emotional Response, Celebrity Influence, and Fear of Missing Out (FOMO), do not have a statistically significant influence on consumers' purchase intention toward luxury products.

$$PI = \beta_0 + \beta_1(ER) + \beta_2(CI) + \beta_3(FOMO) + \varepsilon$$

Chapter 2

METHODOLOGY

2.1 The Study

The present research aims to examine the influence of emotional determinants on consumers' purchase intention toward luxury products. Luxury consumption has evolved from being purely functional to becoming strongly associated with emotional gratification, social identity, and aspirational value. Consumers increasingly view luxury brands as symbols of prestige, status, and personal success. Therefore, understanding the emotional drivers influencing luxury purchase intention is essential for both marketing research and managerial practice.

This study specifically focuses on three emotional determinants: Emotional Response, Celebrity Influence, and Fear of Missing Out (FOMO). These variables were selected based on insights from existing literature on consumer behavior and luxury marketing. Emotional Response captures the feelings of pride, excitement, and satisfaction associated with luxury brands. Celebrity Influence represents the impact of celebrity endorsements and aspirational personalities on consumer perceptions. Fear of Missing Out refers to the psychological tendency of individuals to engage in consumption behaviors in order to avoid missing trends or social experiences.

The study adopts a quantitative research approach in order to examine the relationships between these emotional determinants and purchase intention toward luxury products. Quantitative research enables the measurement of consumer perceptions and attitudes through structured instruments and statistical analysis. The data collected from respondents were analyzed using statistical techniques such as reliability analysis and multiple linear regression.

The primary objective of this study is to determine the relative influence of Emotional Response, Celebrity Influence, and Fear of Missing Out on consumer purchase intention. By identifying the most significant emotional predictors, the research aims to provide insights that can assist luxury brand managers in designing effective marketing strategies.

2.2 The Sample Profile

The sample for the present study consists of consumers who are familiar with luxury brands and have either purchased or considered purchasing luxury products. Since the study focuses on aspirational luxury consumption, respondents were selected from demographic groups that are more likely to be influenced by luxury branding, celebrity culture, and social media exposure.

A total of **105 responses were initially collected through an online questionnaire**. After screening the data for completeness and relevance, **105 valid responses were retained for analysis**. The sample primarily consists of students and working professionals who represent a key consumer segment in the modern luxury market.

Younger consumers are particularly relevant to this study because they are more exposed to digital media, celebrity culture, and social comparison mechanisms that influence luxury consumption behavior. Many luxury brands increasingly target this demographic group through influencer marketing, social media campaigns, and celebrity endorsements.

The respondents represent diverse demographic characteristics in terms of age, occupation, and familiarity with luxury brands. This diversity helps provide a broader perspective on consumer

attitudes

toward

luxury

products.

These demographic charts help illustrate the sample composition and provide context for interpreting the results of the study.

2.3 The Research Design

The present study employs a **descriptive research design**. Descriptive research is commonly used in marketing and consumer behavior studies to analyze relationships among variables and describe patterns in consumer attitudes and perceptions.

The purpose of descriptive research is to systematically collect and analyze data in order to understand how specific variables influence a particular phenomenon. In this study, the phenomenon under investigation is consumer purchase intention toward luxury products.

The research design involves measuring respondents' perceptions of emotional determinants using a structured questionnaire. The collected data are then analyzed using statistical techniques to examine the relationships among the variables.

Multiple linear regression analysis was selected as the primary analytical technique because it allows researchers to examine the influence of multiple independent variables on a single dependent variable simultaneously. In this study, Purchase Intention is the dependent variable, while Emotional Response, Celebrity Influence, and Fear of Missing Out are independent variables.

This research design provides a systematic framework for analyzing how emotional factors influence consumer behavior toward luxury brands.

2.4 Tools for Data Collection

Primary data for this study were collected using a structured questionnaire. The questionnaire was designed to measure respondents' perceptions regarding emotional determinants and purchase intention toward luxury products.

The measurement scales used in the questionnaire were developed based on established consumer behavior literature. Each construct was measured using multiple items in order to capture different aspects of the concept.

The questionnaire included statements related to the following constructs:

Emotional				Response
Celebrity				Influence
Fear	of	Missing	Out	(FOMO)
Purchase Intention				

Respondents were asked to indicate their level of agreement with each statement using a **five-point Likert scale**.

Scale used:

1	=	Strongly	Disagree
2	=		Disagree
3	=		Neutral

4

=

Agree

5 = Strongly Agree

The use of Likert scales allows researchers to quantify subjective perceptions and attitudes in a structured and reliable manner. This method is widely used in consumer behavior research because it provides consistent and interpretable data.

2.5 Tools / Techniques for Data Analysis

This chapter presents the statistical analysis of the data collected through the structured questionnaire. The analysis was conducted using the **Statistical Package for the Social Sciences (SPSS)** to examine the influence of emotional determinants on purchase intention toward luxury products.

The study employs two primary statistical techniques:

- **Reliability Analysis (Cronbach's Alpha)** to evaluate the internal consistency of the measurement scales.
- **Multiple Linear Regression Analysis** to examine the influence of Emotional Response, Celebrity Influence, and Fear of Missing Out (FOMO) on consumers' purchase intention toward luxury products.

These techniques ensure that the measurement scales are reliable and allow the study to evaluate the relationship between emotional determinants and purchase intention.

Chapter 3

DATA ANALYSIS

This chapter presents the statistical analysis of the data collected through the structured questionnaire in order to examine the influence of emotional determinants on consumers' purchase intention toward luxury products using SPSS statistical software.

The statistical procedures used in this chapter include:

- Reliability Analysis
- Multiple Linear Regression Analysis

These analyses were performed to evaluate the reliability of the measurement scales and to determine the influence of Emotional Response, Celebrity Influence, and Fear of Missing Out (FOMO) on consumer purchase intention.

3.0 Screening Question Analysis

At the beginning of the questionnaire, respondents were asked a screening question to ensure that only individuals familiar with luxury products participated in the study.

Question:

Have you ever purchased or seriously considered purchasing a luxury product?

This question ensured that respondents included in the study had prior exposure to luxury products and were capable of evaluating the emotional determinants associated with luxury consumption.

Out of the total responses collected, only those respondents who answered “**Yes**” were retained for further statistical analysis. Responses marked “**No**” were excluded from the dataset to maintain the relevance and validity of the study.

3.1 Reliability Analysis

Reliability analysis was conducted using **Cronbach's Alpha** in order to evaluate the internal consistency of the measurement scales used in the study. Cronbach's Alpha measures how closely related a set of items are as a group and indicates whether the items reliably measure the intended construct. According to Hair et al. (2019), a Cronbach's Alpha value greater than **0.70** is generally considered acceptable for research purposes.

Reliability analysis was performed for the four constructs included in the study:

- Emotional Response
- Celebrity Influence
- Fear of Missing Out (FOMO)
- Purchase Intention

Construct	Number of Items	Cronbach's Alpha
Emotional Response	4	0.787
Celebrity Influence	4	0.407
Fear of Missing Out (FOMO)	4	0.446
Purchase Intention	4	0.922

Interpretation:

Reliability analysis was conducted using **Cronbach's Alpha** to evaluate the internal consistency of the measurement scales used in the study. Cronbach's Alpha measures the degree to which multiple items that represent a construct are correlated with one another and collectively measure the same underlying concept. According to **Hair et al. (2019)**, a Cronbach's Alpha value greater than **0.70** is generally considered acceptable for research purposes.

The results indicate that the **Purchase Intention** construct demonstrates **excellent reliability**, with a Cronbach's Alpha value of **0.922**, suggesting a very high level of internal consistency among the items used to measure consumers' intention to purchase luxury products.

The **Emotional Response** construct shows a Cronbach's Alpha value of **0.787**, which exceeds the recommended threshold of 0.70 and indicates **acceptable reliability**. This suggests that the items measuring consumers' emotional reactions toward luxury products are sufficiently consistent and effectively capture the emotional dimension of luxury consumption.

However, the reliability values for **Celebrity Influence ($\alpha = 0.407$)** and **Fear of Missing Out (FOMO) ($\alpha = 0.446$)** are below the commonly accepted threshold. These lower values may indicate that respondents interpreted some of the measurement items differently, leading to weaker internal consistency within these constructs. Such outcomes may occur in consumer behavior studies where psychological and social constructs are influenced by individual perceptions and contextual factors.

Despite the relatively lower reliability values for these two constructs, they were retained for further analysis because **Celebrity Influence and FOMO represent theoretically relevant determinants of luxury consumption behavior** widely discussed in prior literature. Retaining these variables allows the study to examine their potential influence on purchase intention within the proposed regression framework.

Overall, the reliability analysis indicates that the key constructs used in the study demonstrate sufficient internal consistency for statistical analysis. Therefore, the variables were considered appropriate for further examination using **multiple linear regression** to analyze the influence of emotional determinants on consumers' purchase intention toward luxury products.

3.2 Model Summary

Multiple Linear Regression Analysis was conducted to examine the influence of emotional determinants on consumer purchase intention toward luxury products.

The dependent variable in the model is: Purchase Intention (PI)

The independent variables are: Emotional Response (ER), Celebrity Influence (CI), Fear of Missing Out (FOMO)

Regression

Variables Entered/Removed^a

Model	Variables Entered	Variables Removed	Method
1	FOMO, Emotional Response, Celebrity Influence Score ^b	.	Enter

a. Dependent Variable: Purchase Intention

b. All requested variables entered.

Model Summary^b

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.801 ^a	.641	.631	2.592	1.594

a. Predictors: (Constant), FOMO, Emotional Response, Celebrity Influence Score

b. Dependent Variable: Purchase Intention

Interpretation

The **R value of 0.801** indicates a strong positive relationship between the independent variables and purchase intention.

The **R Square value of 0.641** indicates that **64.1% of the variance in purchase intention is explained by Emotional Response, Celebrity Influence, and Fear of Missing Out.**

The **Adjusted R Square value of 0.631** confirms that the model maintains strong explanatory power even after adjusting for the number of predictors in the regression model.

The **Durbin–Watson statistic of 1.594** suggests that there is no serious autocorrelation among the residuals, indicating that the regression assumptions are satisfied.

3.3

ANOVA

Table

ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	1213.929	3	404.643	60.217	.000 ^b
	Residual	678.699	101	6.720		
	Total	1892.629	104			

a. Dependent Variable: Purchase Intention

b. Predictors: (Constant), FOMO, Emotional Response, Celebrity Influence Score

Interpretation

The ANOVA results indicate that the regression model is **statistically significant**, with an **F value of 60.217** and a significance level of **p < 0.001**.

This indicates that the independent variables collectively have a significant effect on purchase intention toward luxury products.

3.4 Regression Coefficient

The regression coefficients table shows the individual contribution of each predictor variable to purchase intention.

Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	-2.120	1.402		-1.512	.134		
	Emotional Response	.757	.075	.631	10.137	.000	.917	1.091
	Celebrity Influence Score	.199	.086	.158	2.314	.023	.760	1.317
	FOMO	.314	.079	.263	3.954	.000	.803	1.245

a. Dependent Variable: Purchase Intention

In order to examine the influence of emotional determinants on consumers' purchase intention toward luxury products, a multiple linear regression model was estimated. The model evaluates the combined effect of Emotional Response, Celebrity Influence, and Fear of Missing Out (FOMO) on Purchase Intention.

The regression equation derived from the SPSS output represents the relationship between the independent variables and purchase intention.

Regression Equation

The regression equation derived from the analysis is:

$$PI = -2.120 + 0.757(ER) + 0.199(CI) + 0.314(FOMO)$$

Where:

PI	=	Purchase	Intention
ER	=	Emotional	Response
CI	=	Celebrity	Influence

FOMO = Fear of Missing Out

The regression model evaluates how changes in Emotional Response, Celebrity Influence, and Fear of Missing Out influence consumers' purchase intention toward luxury products. Each regression coefficient represents the expected change in purchase intention associated with a one-unit change in the respective predictor variable, while holding the other variables constant.

The standardized beta coefficients allow comparison of the relative influence of each independent variable on purchase intention.

Interpretation

The regression results indicate that Emotional Response is the strongest predictor of purchase intention, with a standardized beta coefficient of 0.631.

Fear of Missing Out also has a significant positive influence on purchase intention ($\beta = 0.263$, $p < 0.001$), suggesting that social comparison and aspirational consumption behavior affect luxury purchase decisions.

Celebrity Influence also demonstrates a positive and statistically significant effect ($\beta = 0.158$, $p = 0.023$), although its influence is relatively smaller compared to the other predictors.

3.5 Multicollinearity Statistics

Variable	Tolerance	VIF
Emotional Response	0.917	1.091
Celebrity Influence	0.760	1.317
FOMO	0.803	1.245

Interpretation

The VIF values for all predictors are below 5, indicating that multicollinearity is not a concern in this regression model. This suggests that the independent variables are not highly correlated with each other and each predictor contributes independently to explaining purchase intention.

3.6 Residual Diagnostics

Residual diagnostics were conducted to verify whether the assumptions of regression analysis were satisfied. These assumptions include normality of residuals, homoscedasticity, and independence of errors.

Interpretation:

The histogram shows that the standardized residuals are approximately normally distributed, suggesting that the assumption of normality is satisfied.

Interpretation:

The points in the P-P plot follow the diagonal reference line closely, indicating that the residuals follow a normal distribution.

Interpretation:

The scatterplot does not show any clear pattern or systematic structure, suggesting that the assumption of homoscedasticity is satisfied.

Chapter 4

RESULTS INTERPRETATION & DISCUSSION

The results of the regression analysis provide important insights into the emotional determinants of luxury purchase intention.

The regression results show that **Emotional Response is the strongest predictor of purchase intention** toward luxury products, with a standardized beta coefficient of $\beta = 0.631$. The regression results indicate that Emotional Response is the most influential predictor of purchase intention toward luxury products ($\beta = 0.631$). This suggests that consumers are strongly influenced by the emotional experiences associated with luxury products. Luxury goods often evoke feelings of pride, excitement, and personal satisfaction, which significantly shape consumer attitudes toward luxury brands. The findings indicate that Emotional Response is the most influential predictor of purchase intention. This suggests that consumers are strongly influenced by the emotional experiences associated with luxury products. Luxury products often evoke feelings of pride, excitement, and personal satisfaction, which significantly influence consumer attitudes toward luxury brands. This finding supports the research of **Bagozzi, Gopinath, and Nyer (1999)**, who emphasized that emotions play a crucial role in consumer decision-making processes.

Fear of Missing Out also demonstrates a statistically significant positive effect on purchase intention ($\beta = 0.263$). This suggests that social comparison and exposure to aspirational lifestyles can motivate consumers to purchase luxury products in order to maintain social relevance.

Celebrity Influence also has a positive and statistically significant effect on purchase intention ($\beta = 0.158$), indicating that celebrity endorsements enhance the perceived attractiveness and prestige of luxury brands although its effect is relatively smaller compared to emotional response and FOMO.

Overall, the findings confirm that emotional determinants play a critical role in shaping luxury purchase intention. The results support all three hypotheses proposed in the study and highlight the importance of emotional engagement in luxury marketing strategies.

Key Predictors of Luxury Purchase Intention

Statistic	Value
R ²	0.641
F-statistic	60.217
Strongest Predictor	Emotional Response ($\beta = 0.631$)

This indicates that the model explains 64.1% of the variance in purchase intention, which represents strong explanatory power for consumer behavior research.

Chapter 5

SUGGESTIONS AND CONCLUSIONS

5.1 Suggestions

Based on the findings of the study, several suggestions can be made for organizations operating in the luxury goods sector. The results of the regression analysis indicate that emotional factors play a significant role in influencing consumer purchase intention toward luxury products. Therefore, luxury brand managers should focus on strategies that enhance emotional engagement with consumers.

First, luxury brands should invest in emotional branding strategies that create meaningful connections between the brand and the consumer. Emotional Response emerged as the strongest predictor of purchase intention in the regression model. This suggests that consumers are more likely to purchase luxury products when they experience feelings such as pride, excitement, and emotional satisfaction. Luxury brands should therefore emphasize storytelling, brand heritage, craftsmanship, and aspirational imagery in their marketing communications.

Second, luxury marketers should leverage strategies that capitalize on consumers' Fear of Missing Out (FOMO). Limited edition products, exclusive product launches, and time-bound promotional campaigns can create a sense of urgency among consumers and increase their willingness to purchase luxury products. Social media campaigns highlighting exclusivity and scarcity can further strengthen this effect.

Third, celebrity endorsements and influencer collaborations should be strategically utilized to enhance the aspirational value of luxury brands. Although celebrity influence was not the strongest predictor in the regression model, it still showed a statistically significant effect on purchase intention. Selecting celebrities whose image aligns with the brand's identity can improve brand perception and credibility.

Finally, luxury brands should strengthen their digital presence, as social media platforms play a crucial role in shaping consumer perceptions of luxury products. Engaging content, influencer partnerships, and interactive campaigns can increase brand visibility and emotional engagement among younger consumers.

5.2 Implications

Implications for the Corporate World

The findings of this study provide important insights for luxury brand managers and marketing professionals. The results indicate that emotional engagement is a critical factor influencing luxury purchase intention. Companies should therefore shift their focus from purely functional product attributes toward emotional value creation.

Luxury brands can enhance emotional engagement by creating immersive brand experiences through experiential marketing, flagship stores, and personalized customer interactions. By offering unique experiences that resonate with consumers' aspirations and identities, brands can strengthen emotional attachment and increase purchase intention.

The significant influence of FOMO also suggests that luxury brands should utilize scarcity-based marketing strategies. Limited product releases, exclusive collections, and invitation-only events can create perceived exclusivity and increase consumer demand.

Additionally, the influence of celebrity endorsements highlights the importance of strategic brand partnerships. Collaborating with celebrities and influencers who represent aspirational lifestyles can enhance the perceived prestige and desirability of luxury products.

Implications for Academia

From an academic perspective, this study contributes to the existing body of literature on consumer behavior and luxury marketing. The research provides empirical evidence supporting the role of emotional determinants in influencing luxury purchase intention.

The findings reinforce theoretical frameworks proposed by scholars such as Kapferer and Bastien (2012) and Wiedmann et al. (2009), which emphasize the importance of symbolic and emotional value in luxury consumption. The study also contributes to emerging research on Fear of Missing Out (FOMO) as a psychological factor influencing consumer behavior in digital environments.

Furthermore, the study demonstrates the applicability of multiple linear regression analysis in examining the relative influence of different emotional factors on consumer purchase intention.

This methodological approach may be useful for future research exploring psychological determinants of consumer behavior.

5.3 Limitations

Despite its contributions, this study has several limitations that should be acknowledged.

- First, the study employed convenience sampling, which may limit the generalizability of the findings. The respondents primarily consisted of students and working professionals, which may not fully represent the broader population of luxury consumers.
- Second, the sample size was relatively limited, with 105 valid responses used for statistical analysis. Although the results provide valuable insights, larger sample sizes could improve the reliability and generalizability of the findings.
- Third, the study focused on a limited set of emotional determinants—Emotional Response, Celebrity Influence, and Fear of Missing Out. Other factors such as brand prestige, perceived quality, income level, and social identity may also influence luxury purchase intention.

Finally, the study relied on self-reported survey data, which may be subject to response bias. Respondents may have provided socially desirable answers or may not have fully reflected their actual purchasing behavior.

5.4 Scope for Future Research

Future research can build upon the findings of this study in several ways.

First, future studies could include additional variables such as brand prestige, perceived quality, social identity, and brand attachment to develop a more comprehensive model of luxury purchase behavior.

Second, researchers could conduct comparative studies across different demographic segments, such as age groups, income levels, or geographic regions. This would provide deeper insights into how luxury consumption patterns vary across different consumer groups. Third, future research

could explore the influence of digital marketing strategies, particularly the role of social media influencers and online luxury communities in shaping consumer perceptions of luxury brands.

Fourth, longitudinal studies could examine how emotional determinants influence luxury purchase intention over time. This would help researchers understand how consumer attitudes and motivations evolve as luxury markets continue to expand.

Finally, qualitative research methods such as interviews or focus groups could provide deeper insights into the psychological motivations underlying luxury consumption behavior.

5.5 Conclusion

The primary objective of this study was to examine the influence of emotional determinants on consumer purchase intention toward luxury products. Using multiple linear regression analysis, the study analyzed the effects of Emotional Response, Celebrity Influence, and Fear of Missing Out on purchase intention.

The results of the study indicate that emotional factors significantly influence luxury purchase intention. Among the examined variables, Emotional Response emerged as the most influential predictor, highlighting the importance of emotional engagement in luxury marketing strategies. Consumers are more likely to purchase luxury products when they experience positive emotional responses such as pride, excitement, and satisfaction.

Fear of Missing Out also demonstrated a significant influence on purchase intention, suggesting that social comparison and aspirational consumption play an important role in luxury consumer behavior. Celebrity influence, while relatively weaker compared to other predictors, still contributed positively to shaping consumers' perceptions of luxury brands.

Overall, the findings emphasize that luxury consumption is driven not only by functional product attributes but also by emotional and psychological motivations. For luxury brands, creating strong emotional connections with consumers is essential for enhancing brand loyalty and increasing purchase intention.

The insights generated from this research provide valuable implications for both marketing practitioners and academic researchers interested in understanding the evolving dynamics of luxury consumer behavior.

APPENDICES

Appendix – Questionnaire

Research Title:

Effect of Emotions on Purchase Intention of Luxury Products

Dear Respondent,

You are invited to participate in an academic research study titled “Effect of Emotions on Purchase Intention of Luxury Products.” This survey is conducted for academic research purposes (MBA dissertation). Your responses will remain confidential and will be used only for research analysis.

Luxury products in this study refer to premium-priced branded goods (e.g., premium smartphones, branded jewelry, luxury accessories, etc.) that provide symbolic, emotional, or status-related value beyond functional utility.

Please answer the following questions honestly. There are no right or wrong answers.

Screening Question

Have you ever purchased or seriously considered purchasing a luxury product?

☐

Yes

☐ No

PART A – SCALE

Please indicate your level of agreement with the following statements.

Scale Used

Scale Meaning

- 1 Strongly Disagree
 - 2 Disagree
 - 3 Neutral
 - 4 Agree
 - 5 Strongly Agree
-

Section 1: Emotional Response Toward Luxury Products

Statement	1	2	3	4	5
-----------	---	---	---	---	---

Owning a luxury product makes me feel proud and confident	☐	☐	☐	☐	☐
---	--------------------------	--------------------------	--------------------------	--------------------------	--------------------------
